

NB3V110xC Series

3.3V/2.5V/1.8V LVCMOS Low Skew Fanout Buffer Family

Description

The NB3V110xC are a modular, high-performance, low-skew, general purpose LVCMOS clock buffer family. The family of devices is designed with a modular approach. Four different fan-out variations, 1:2, 1:3, 1:4, 1:6 and 1:8, are available. All of the devices are pin compatible to each other for easy handling. All family members share the same high performing characteristics like low additive jitter, low skew, and wide operating temperature range. The NB3V110xC supports an asynchronous output enable control (OE) which switches the outputs into a low state when OE is low. The NB3V110xC devices operate in a 3.3 V, 2.5 V and 1.8 V environment and are characterized for operation from -40°C to 105°C .

Features

- Operating Temperature Range: -40°C to 105°C
- High-Performance 1:2, 1:3, 1:4, 1:6, 1:8 LVCMOS Clock Buffer
- Available in 8-, 14-, 16-Pin TSSOP and WDFN8 Packages
- Very Low Output-to-Output Skew < 50 ps
- Very Low Additive Jitter < 200 fs
- Supply Voltage: 3.3 V, 2.5 V or 1.8 V
- $f_{\text{max}} = 250 \text{ MHz}$ for 3.3 V; $f_{\text{max}} = 180 \text{ MHz}$ for 2.5 V;
 $f_{\text{max}} = 133 \text{ MHz}$ for 1.8 V
- These Devices are Pb-Free and are RoHS Compliant

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

5. All typical values are at respective nominal V_{DD} . For switching characteristics, outputs are terminated to 50 Ω to $V_{DD}/2$ (see Figure 2).

6. This is the formula for the power dissipation calculation.

$$P_{tot} = P_{stat} + P_{dyn} + P_{Cload} \text{ [W]} \quad P_{stat} = V_{DD} \times I_{DD} \text{ [W]}$$

$$P_{dyn} = C_{PD} \times V_{DD}^2 \times f \times n \text{ [W]}$$

$$P_{Cload} = C_{load} \times V_{DD}^2 \times f \times n \text{ [W]}$$

n = Number of switching output pins

7. With rail to rail input clock.

8. $t_{sk(p)}$ depends on output rise- and fall-time (t_r/t_f). The output duty-cycle can be calculated: $odc = (t_{w(OUT)} \pm t_{sk(p)})/t_{period}$; $t_{w(OUT)}$ is pulse-width of ideal output waveform and period is $1/f_{OUT}$.

Figure 9. Typical NB3V110xC Phase Noise Plot at $f_{Carrier} = 100 \text{ MHz}$, $V_{DD} = 3.3 \text{ V}$, 25°C

The above phase noise data was captured using Agilent E5052A/B. The data displays the input phase noise and output phase noise used to calculate the additive phase jitter at a specified integration range. The additive RMS phase jitter contributed by the device (integrated between 12 kHz and 20 MHz) is 55.94 fs. The additive RMS phase jitter performance of the fan out buffer is highly dependent on the phase noise of the input source.

To obtain the most precise additive phase noise measurement, it is vital that the source phase noise be notably lower than that of the DUT. If the phase noise of the source is greater than the noise floor of the device under test, the source noise will dominate the additive phase jitter calculation and lead to an incorrect negative result for the additive phase noise within the integration range. The Figure above is a good example of the NB3V110xC source generator phase noise having a significantly lower floor than the DUT and results in an additive phase jitter of 55.94 fs.

$$\text{Additive RMS phase jitter} = \sqrt{\text{RMS phase jitter of output}^2 - \text{RMS phase jitter of input}^2}$$

$$55.94 \text{ fs} = \sqrt{66.92 \text{ fs}^2 - 36.72 \text{ fs}^2}$$

NB3V110xC Series

Figure 10. Typical NB3V110xC Phase Noise Plot at $f_{\text{carrier}} = 156.25 \text{ MHz}$, $V_{\text{CC}} = 3.3 \text{ V V}$, 25°C

The additive RMS phase jitter contributed by the device (integrated between 12 kHz and 20 MHz) is 46.11 fs.

$$\begin{aligned} \text{Additive RMS phase jitter} &= \sqrt{\text{RMS phase jitter of output}^2 - \text{RMS phase jitter of input}^2} \\ 46.11 \text{ fs} &= \sqrt{51.76 \text{ fs}^2 - 23.5 \text{ fs}^2} \end{aligned}$$

Figures 9 and 10 were created with measured data from Agilent-E5052A/B Signal Source Analyzer using ON Semiconductor Phase Noise Explorer web tool. This free application enables an interactive environment for advanced

phase noise and jitter analysis of timing devices and clock tree designs. To see the performance of NB3V110xC beyond conditions outlined in this datasheet, please visit the ON Semiconductor [Green Point Design Tools](#) homepage.
